

**SMITHSONIAN
HERPETOLOGICAL
INFORMATION
SERVICE**

The SHIS series publishes and distributes translations, bibliographies, indices, and similar items judged useful to individuals interested in the biology of amphibians and reptiles, but unlikely to be published in the normal technical journals. Single copies are distributed free to interested individuals. Libraries, herpetological associations, and research laboratories are invited to exchange their publications with the Division of Amphibians and Reptiles.

We wish to encourage individuals to share their bibliographies, translations, etc. with other herpetologists through the SHIS series. If you have such items please contact George Zug for instructions on preparation and submission. Contributors receive 50 free copies.

Please address all requests for copies and inquiries to George Zug, Division of Amphibians and Reptiles, National Museum of Natural History, Smithsonian Institution, Washington DC 20560 USA. Please include a self-addressed mailing label with requests.

INTRODUCTION

The mountains of eastern Cuba mountains are the main center of floristic and faunistic diversity and have the highest endemism on the island. Considering only the vertebrates, these mountains harbor 71% of Cuba's species and 30% of its endemic species (Fong, 1994). Specifically, the Sagua-Baracoa Mountains contain, together with Sierra Maestra, the most endemic amphibians and reptiles and the greatest number of species. Fifty-three percent of Cuban amphibians and 45.6% of Cuban reptiles occur in Sagua-Baracoa. Although these mountains comprise less than a fourth of the Cuban territory, they have half of the Cuban herpetofauna.

The high endemism (93.1% in amphibians and 74.2% in reptiles), along with 40% of the species being typical of Sagua-Baracoa, contribute to the national and global importance of this area. For this reason, we prepared the following checklist. It includes all species of amphibians and reptiles of Sagua-Baracoa described through June 2000. The list also summarizes the endemism and distribution of the S-B herpetofauna. Despite the currency of this report, it is not conclusive because new species continue to be described. We agree with the statement of Schwartz and Henderson (1991): "we hope that new species are discovered and described for many years to come".

The compilation of this checklist is based on the author's field work and observations throughout the eastern Cuba, as well as data from the Cuban herpetological collections of the Instituto de Ecología y Sistemática, Museo Nacional de Historia Natural, Museo de Historia Natural de Holguín, and Centro Oriental de Ecosistemas y Biodiversidad (BIOECO) of Santiago de Cuba. We also used the herpetological database created for a previous work (Fong, 1994), in which all literature about Eastern Cuban vertebrates through 1993 was reviewed. In addition to that literature we include new species descriptions from 1994 onward.

We define the Sagua-Baracoa Mountains (following Nuñez et al., 1989) as consisting of the Sierra de Nipe (SN), Alturas del Segundo Frente (SF), Sierra del Cristal (SC), Sierra de Sagua de Tánamo (ST), Gran Meseta de Guantánamo (MG), Cuchillas de Toa (CT), Alturas de Moa (AM), Cuchillas y Mesas de Baracoa-Imías (CB), Gran Meseta Cársica de Baracoa (MB), Mesas Costeras Aterrazadas de Guantánamo-Cajobabo (TG) and Llanura Costera Yaguaneque-Baracoa (LC). For a detailed map of the Sagua-Baracoa region see Nuñez et al. (1989).

Abbreviations are as follow: EN = Endemism, E = Cuban endemic, R = Regional Cuban endemic (known only from Sagua-Baracoa), L = Local Cuban endemic (known only from isolated localities in Sagua-Baracoa), - = No endemic species, I = Introduced species.

Acknowledgements

Most results of this report derive from the "Diversidad Biológica de los Macizos Montañosos Sierra Maestra y Nipe-Sagua-Baracoa" project, which supported portions of our field work. Luis V. Moreno and Orlando H. Garrido provided very valuable assistance to our studies in the last years. S. Blair Hedges sent us some important literature on the Cuban herpetofauna. Iliana Boza and Dylan Robison help us with the translation to English.
